

Angle facts

gether	Angle totals	
	Right angle - 90°	
straight lines. Derties f exactly 90° hes of the angle dicular to each	Straight line - 180° Two angles that make a straight line total 180°	
t <b>hat is less</b> ° to 89°)	The 3 angles of a triangle always total 180°	
ines join to aight line, the ed is two right ether - 180°	Angles around a point total 360° (4 right angles)	
greater than a but less than a ne (91° to 179°)	Complementary angles (where 2 straight lines cross) are equal	
greater than a ne (181° to 359°) ack on itself	Angles in a quadrilateral	

## An angle is the measure of turn between two straight lines.

Name	Examples	Properties
right angle		<ul> <li>An angle of exactly 90°</li> <li>The two lines of the angle are perpendicular to each other</li> </ul>
acute angle		<ul> <li>Any angle that is less than 90° (1° to 89°)</li> </ul>
straight line		<ul> <li>when two lines join to make a straight line, the angle formed is two right angles together - 180°</li> </ul>
obtuse angle		<ul> <li>Any angle greater than a right angle but less than a straight line (91° to 179°)</li> </ul>
reflex angle	R	<ul> <li>Any angle greater than a straight line (181° to 359°)</li> <li>It bends back on itself</li> </ul>
